

# Joint Maritime Information Center

## Update 075 to JMIC Advisory Note:

01 March – 23 July 2026

Regional Tension - Impact on Maritime Security

### Area of Concern:

Middle East Maritime Region

JMIC# 001-26

Regional Threat Level: SEVERE

### 1. Confirmed Maritime Security Incidents List since last report

| Date                          | Vessel            | Vessel Type | Event Type | Location                                               | Narrative                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|-------------------|-------------|------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 22 July 2026,<br>UKMTO 095-26 | Name withheld UFN | Tanker      | Attack     | Southern Red Sea, 70 NM from the coast of Saudi Arabia | On 23 July 2026, JRCC UK relayed a distress alert from a laden Saudi-flagged products tanker that the vessel was struck on its starboard side by an unknown projectile while transiting south in the Southern Red Sea. Crew reported safe, and conducted fire-fighting. Fire extinguished, vessel at anchor, environmental impact unknown. |

### 2. Operational Summary – Last 48 Hours

#### Arabian Gulf (No change)

Traffic flows remained stable, with anchorage congestion unchanged across the region.

Navigational system interference and wider regional military activity continued to warrant caution, and recurring GNSS interference persisted at consistent levels.

#### Strait of Hormuz

Commercial traffic through the Strait of Hormuz remained at reduced levels, with vessels transiting via both the southern Omani corridor and the northern Iranian-controlled route.

Operator caution persisted following previous attacks, and several companies continued to delay or reschedule passages. Some vessels transited with AIS disabled, further reducing visible traffic density.

US-assisted commercial transits continued with fewer ships, reflecting heightened operator risk assessments under the elevated threat environment. The pattern remained broadly consistent with the previous 24–48 hours—no surge in escorted traffic, but steady, limited movements.

Throughout the period, IRGC harassment activity persisted, including hailing, UAS overflight, and targeted surveillance of merchant shipping. These actions reflected Iran's intent to assert presence along key transit lanes and maintain pressure on AIS-active vessels.

Missile strikes against Iranian coastal infrastructure in the Bandar Abbas region and wider coastal areas continued to contribute to elevated maritime security tensions, prompting heightened Iranian patrol and surveillance activity, but without new confirmed attacks on shipping in the Strait during the period.

Commercial traffic fell to a three-week low, with several vessels transiting with AIS disabled due to concerns over targeting or misidentification. This behaviour further reduced traffic density and reinforced operators' cautious posture under the elevated threat environment.

There remained a continued risk of drifting or uncharted mines in and near the TSS, with mine danger areas still active.

### **Gulf of Oman (No change)**

Traffic flows in the Gulf of Oman remained stable, with vessels maintaining heightened awareness amid ongoing naval activity. Multinational forces continued clearance and monitoring operations, and merchant vessels reported occasional VHF hails, primarily to verify transit intentions.

Naval presence remained elevated, due to blockade enforcement activity.

During the period, vessel movements began to concentrate along preferred routing patterns, resulting in increased congestion in the Gulf of Oman.

Vessels were expected to respond promptly to military queries and maintain AIS visibility unless constrained by security threats. Operators continued to exercise caution due to regional strike activity, and ongoing IRGC monitoring of shipping in adjacent waters.

### **Arabian Sea (No change)**

The northern Arabian Sea remains calm with no confirmed maritime security incidents in the last 48 hours. Naval forces continue routine patrols, and commercial traffic is transiting without disruption. The broader operating environment remains influenced by regional tensions, but no direct impacts on merchant shipping have been reported in this period.

### **Gulf of Aden (No change)**

Commercial traffic remained steady in the Gulf of Aden.

Threats associated with historical skiff activity and piracy-related approaches persisted, but no incidents were reported during the period. Operator caution remained elevated due to recent regional activity, though vessel movements continued without disruption.

Vessels were advised to maintain BMP-compliant watchkeeping throughout the IRTC.

### **Southern Red Sea & Bab el Mandeb**

Commercial traffic continued to transit steadily through the Southern Red Sea and Bab el Mandeb; however, the security posture shifted following the confirmed Houthi attack on a Saudi-flagged tanker, in which the vessel was struck by an unknown projectile and subsequently caught fire. The incident demonstrates a renewed willingness and capability by Houthi forces to target specified merchant shipping.

Houthi forces have reiterated claims that the Bab el Mandeb is closed to Saudi-affiliated vessels, and recent messaging continues to emphasise hostile intent toward vessels perceived as linked to Saudi interests. Regional reporting maintains that Iran has instructed the group to remain prepared to close the Red Sea oil route should broader regional escalation occur.

Sources close to the group stated that the Houthis have completed preparations to attack shipping, including the deployment of missiles and drones positioned near Bab el-Mandeb.

Open source intelligence reports suggest sources close to the group indicate that the Houthis have moved from posturing to active targeting, evidenced by the recent attack and supported by the reported forward deployment of missiles and drones positioned near Bab el Mandeb.

No confirmed large-scale rerouting has been reported, though operators may adjust posture on a vessel-by-vessel basis. Coalition naval units are present in the area.

#### **Somali Coast and Somali Basin (No change)**

No piracy incidents were reported in the last 48 hours. Three merchant vessels remain held:

- Oil/products tanker – held since 21 April 2026
- General cargo / cement carrier – held since 26 April 2026
- Oil tanker – held since 02 May 2026; taken 10 NM off the Yemen coast and diverted toward Somali waters; status unconfirmed

#### **Northern Red Sea & Suez Canal (No change)**

No confirmed attacks or disruptions. Suez Canal transits continue normally. Reports of elevated GNSS interference persist in the vicinity of Yanbu, though without operational impact on traffic flow.

#### **Eastern Mediterranean (No change)**

No maritime attacks have been reported. Periodic electronic and navigational interference continued near Cyprus and the Levant. Naval presence remained, and vessels were advised to maintain prudent separation from military units.

### 3. Regional Threat overview

JMIC Threat Scale: ● Low | ● Moderate | ● Substantial | ● Severe | ● Critical

| Region                           | Threat Level       | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Arabian Gulf                     | <b>MODERATE</b>    | Navigation interference and residual kinetic risk persist; an attack is possible but not likely under current conditions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Strait of Hormuz                 | <b>SEVERE</b>      | Iranian attacks, fourteen since 25 June, have kept the threat level at SEVERE, with deliberate hostile action assessed as highly likely under current conditions. Navigation interference persists, and mine-risk reporting remains relevant within and adjacent to the TSS. Although no new incidents have been confirmed in the latest reporting period, the threat environment remains heightened and warrants increased vigilance.<br><br>IRGC attacks, hailing, and routing pressure continue, particularly for AIS-active vessels.                                                                                                                                                                                                                                                                          |
| Gulf of Oman                     | <b>SUBSTANTIAL</b> | Residual strike-linked risk keeps the threat level at SUBSTANTIAL, and an attack is a strong possibility under current conditions. Naval presence remains visible, with ongoing monitoring, hailing, and verification queries, particularly near approaches to the Strait of Hormuz.<br><br>Enforcement activity poses no direct impact to neutral shipping transits in the Gulf of Oman. Electronic interference continues to present a credible concern for operators.                                                                                                                                                                                                                                                                                                                                          |
| Arabian Sea                      | <b>MODERATE</b>    | Residual conflict-linked risk persists, but no attacks have been reported and current indicators suggest no imminent change to the threat environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Gulf of Aden                     | <b>SUBSTANTIAL</b> | Nine piracy-related events since 11 June keep the threat level as SUBSTANTIAL, with PAG activity a strong possibility in coastal approaches, transit corridors, and established small-craft areas. Southwest monsoon conditions limit offshore skiff operations, but coastal and sheltered zones remain conducive to opportunistic movement. Vessels should maintain heightened vigilance, uphold BMP-compliant posture, and report suspicious activity to UKMTO.                                                                                                                                                                                                                                                                                                                                                 |
| Bab el-Mandeb / Southern Red Sea | <b>SUBSTANTIAL</b> | The threat level is raised to <b>SUBSTANTIAL</b> following the suspected Houthi attack on a Saudi-flagged tanker in the Southern Red Sea. The strike demonstrates active targeting capability and a clear willingness to engage merchant shipping. Houthi messaging continues to assert that the Bab el Mandeb is closed to Saudi-affiliated vessels, reinforcing hostile intent toward vessels perceived as linked to Saudi interests. Forward-deployed missile and drone systems near Bab el Mandeb remain in place, and regional reporting indicates the group has been instructed to remain prepared to disrupt the Red Sea oil route should broader escalation occur.<br><br>Based on the recent attack, sustained intent, and maintained capability, additional attacks are assessed as strong possibility. |
| Somali Coast / Somali Basin      | <b>MODERATE</b>    | PAG activity remains possible; monsoon conditions restrict offshore skiffs but coastal opportunism persists.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Northern Red Sea / Suez Canal    | <b>MODERATE</b>    | No attacks or disruptions reported. Suez Canal operations remain normal. Periodic EMI/GNSS interference remains possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Eastern Mediterranean            | <b>LOW</b>         | Localized EMI/GNSS disruptions persist, and regional naval presence remains steady. No maritime attacks or hostile approaches have been reported, and the threat to commercial shipping is assessed as unlikely.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 4. Maritime Incidents & Traffic Assessment

### 4A. Confirmed Vessel Incidents (Since 1 March)

Total of 73 incidents since 1 March; one incident since last report.

### 4B. Infrastructure Incidents (Last 48 Hours)

No attacks on ports or maritime infrastructure reported.

The overall risk remains MODERATE, driven by the potential for renewed kinetic activity and ongoing uncertainty along Iranian coastal areas. Recent UAS activity continues, and while regional strikes have occurred outside the maritime domain, no indications of targeting port or maritime infrastructure have been confirmed.

### 4C. Traffic Trends

- Strait of Hormuz:
  - Historical average: ~138 vessels/day
  - U.S. – assisted SoH transits facilitated 21 -22 July (past 48 hours): 15
  - 21 July: 4 transits
  - 22 July: 3 transits
- Bab el-Mandeb:
  - 69 vessel transits in past 48 hours
  - Still below pre-2023 baseline

*\* Metrics are derived from U.S. NCAGS (U.S.-facilitated SoH transits), S&P Maritime, and SeaVision data, and exclude vessels calling Iranian ports adjacent to the Strait of Hormuz. S&P and SeaVision reporting thresholds apply to vessels exceeding 1,000 deadweight tons.*

### 4D. Port & Anchorage Congestion (No change)

High vessel density persists across major Arabian Gulf anchorages, with overall congestion remaining stable following the earlier outbound surge. Over the last 48 hours, Strait of Hormuz traffic continued at reduced levels, with no sustained increase along the southern Omani corridor. Flows continue to sit below pre-conflict levels, with a moderate decline still evident.

Periodic repositioning within anchorages remains advisable to avoid long-term predictability and to maintain safe separation in congested areas.

### 4E. GNSS / AIS Interference (No change)

GNSS interference remains consistent across the Strait of Hormuz approaches, the Gulf of Oman, the Arabian Gulf, the central Red Sea, and the Suez Canal approaches. Elevated electronic interference persists in the vicinity of Yanbu.

## 5. Outlook (24–48 Hours)

### Arabian Gulf (No change)

The operating environment is assessed as moderate, with continued navigational system interference and residual kinetic risk. An attack is possible but not likely under current conditions. Rapid, short-notice actions near Iranian coastal waters and anchorages remain possible.

Vessels stationary for extended periods, or maintaining AIS transmission while static, may still face elevated targeting risk.

### **Strait of Hormuz (No change)**

Maritime traffic through the Strait of Hormuz is expected to remain at reduced levels across both the northern Iranian-controlled route and the southern Omani corridor. Operator caution continues, driven by recent attacks, ongoing U.S. blockade enforcement, and elevated regional tension.

The U.S. blockade continues to be enforced. Unauthorized entry or departure may result in interception or force. Neutral transit is permitted, but vessels should expect visit-and-search checks, strong U.S. naval presence, persistent IRGC monitoring, and increased VHF hails. A 30 NM standoff from U.S. units is advised to reduce misidentification risk.

A vetted humanitarian-cargo exemption remains in place, requiring submission to NAVCENT NCAGS. Approved vessels may transit but remain subject to inspection and may not load cargo in Iran beyond fuel and stores.

The regional threat level is assessed as SEVERE, with deliberate hostile action considered highly likely under current conditions. Vessels transiting with AIS active can expect to receive directed hails instructing them to divert toward the northern Iranian-controlled route.

Navigation interference persists, and mine-risk reporting remains relevant within and adjacent to the TSS. Clearance and mine-surveying operations continue throughout the Strait of Hormuz, with updated coordinates and graphics available from U.S. NCAGS ([m-ba-navcent-ncags@us.navy.mil](mailto:m-ba-navcent-ncags@us.navy.mil)). Vessels should remain vigilant and maintain heightened situational awareness during all approaches.

### **Gulf of Oman (No change)**

The threat level remains SUBSTANTIAL, driven by residual strike-linked risk, and an attack is a strong possibility under current conditions. Naval presence remains elevated, with continued monitoring, hailing, and verification queries, particularly near approaches to the Strait of Hormuz.

The U.S. blockade continues to be enforced. Unauthorized entry or departure may result in interception or force. Neutral transit is permitted, but vessels should expect visit-and-search checks, strong U.S. naval presence, persistent IRGC monitoring, and increased VHF hails. A 30 NM standoff from U.S. units is advised to reduce misidentification risk.

Electronic interference continues to present a credible concern. Masters are advised to maintain prudent standoff distances from naval units to reduce misidentification risk and ensure continuous monitoring of VHF Channel 16. The operating environment requires heightened situational awareness throughout all approaches.

### **Arabian Sea (No change)**

No significant change in the operating environment. The regional posture remains stable, with no confirmed maritime attacks reported. Residual risk persists due to broader regional tensions, but an attack is possible but not likely, and current indicators do not suggest any shift toward increased threat levels in the near term.

### **Gulf of Aden (No change)**

The threat of hostile small-craft activity remains elevated, with intermittent skiff presence still assessed as possible in the wider area despite the seasonal monsoon. Small-craft groups retain the capability to conduct aggressive close-approach behaviour, underscoring the need for sustained vigilance throughout the IRTC and adjacent coastal zones.

The operating environment continues to support opportunistic movement in coastal and sheltered areas, particularly within established small-craft operating zones. Southwest monsoon conditions

remain firmly established, with coastal waters offering favourable conditions for small-boat activity. Fresh to strong easterly winds and 2.0–3.0 m seas in open waters further degrade offshore conditions, narrowing operating windows for extended-range skiff activity. Skiff mobility remains possible nearshore, while offshore operations are increasingly constrained.

#### **Southern Red Sea / Bab el Mandeb**

Houthi messaging remains elevated, including the formal 20 July declaration of a maritime blockade targeting Saudi-linked vessels. The scope of the announcement remains selective, but the recent attack on a tanker demonstrates both intent and capability to strike merchant shipping. This marks a clear shift from rhetoric to operational employment.

In the near term commercial routing for non-Saudi-linked vessels is expected to continue through established lanes, though operators may adopt heightened caution and adjust speed, timing, or onboard posture. A reduction in traffic involving Saudi port calls or vessels perceived as Saudi-linked is possible as operators reassess exposure. Broader commercial flows may show moderate short-term variability as companies evaluate alternative routing options. The environment is increasingly dynamic, and vessels should anticipate closer monitoring and potential short-notice navigational adjustments. GNSS interference is expected to persist as a residual hazard, with periodic effects extending from the central Red Sea into the southern sector.

For general commercial traffic, no coordinated or imminent hostile action is indicated, though within the broader threat picture additional attacks are assessed as a strong possibility.

#### **Somali Coast and Somali Basin (No change)**

PAG activity remains possible across the Somali Coast and Somali Basin, with overall likelihood assessed as MODERATE. Southwest monsoon conditions continue to degrade offshore environments, with 2.0–3.0 m seas and moderate to strong southwesterly winds severely restricting extended-range skiff operations.

Despite monsoon onset, coastal waters remain comparatively sheltered, sustaining residual opportunistic piracy risk in nearshore areas where small-boat activity remains feasible.

#### **Northern Red Sea / Suez (No change)**

The environment remains stable with no indicators of maritime escalation. Periodic EMI and GNSS disruptions are likely to continue.

#### **Eastern Mediterranean (No change)**

The operating environment in the Eastern Mediterranean remains stable, with the threat level assessed as LOW. Periodic electronic and navigational interference may still be encountered near Cyprus and the Levant, but no recent maritime security incidents have been reported.

Naval presence remains, and vessels should maintain prudent separation from military units.
